1. Introduction

As part of a collaborative research project conducted by Eawag/Sandec and Makerere University, 180 faecal sludge samples were collected and analyzed in Kampala, Uganda from November 2013 to April 2014. Presented in this report are quantitative and qualitative results, alongside pictures of 76 samples taken in the laboratory and from the onsite location where samples were collected. This information is expected to be helpful to further understand the characteristics and variability of different sources of faecal sludge, and also to develop qualitative knowledge regarding the visual appearance of faecal sludge with different characteristics. Some of this data has been used in the preparation of a journal article (Schoebitz et al. submitted). We are also sharing it here, because to our knowledge it is the first time that such extensive knowledge of faecal sludge characteristics has been made openly available in one document. By the end of the sampling campaign, the research assistant who processed all of these samples was able to reliably predict the range of COD in the sample based on a qualitative visual analysis of foam, color and viscosity (but on odor). We are hoping that some of this laboratory experience can be transferred by sharing these results. Potentially this could lead to inexpensive field methods for estimated characterization of faecal sludge in the field or at treatment plant inlets in low-income countries. Viscosity and odor can be qualitative predictors of COD and total solids with long-term experience, and to a certain extent color.

For samples where COD results were available, the results are presented by the following ranges of COD concentration: <5000 mg/L COD; 5,001–10,000; 10,001–20,000; 20,001–30,000; 30,001–40,000; 40,001–50,000; >50,001. In addition, presented in

the last section are samples where COD values were not measured due to a lack of laboratory supplies. It is felt that they also include useful information as all other parameters are reported.

For each of the samples, a research assistant followed a collection and transport truck to the customer location and observed the emptying operation. The questionnaire information presented on page 4 was used to collect data on sludge origin from the crew operating the truck and from the customer receiving emptying services. The truck was then followed back to Bugolobi Treatment Plant where samples were collected from the truck during discharge. Samples were collected in a ratio of 1:2:1 during the initial discharge, middle discharge, and final discharge. An example of the sampling and questionnaire procedure is presented in photo 1. They were then placed in a cooler on ice for transport to the laboratory and stored at 4°C until the following day for analyses. Qualitative assessments of foam, smell, viscosity and color were made based on observation from a ranking of 1 (weak) to 3 (strong).

All methods for quantitative analyses of chemical and physical characteristics are available on the Sandec website: www.sandec.ch/fsm_tools. Questionnaire information

Questions to driver

- What is the volume of your truck?
- Who does the truck belong to?
- Is your truck completely full (following the emptying event)?
- Was the customers onsite faecal sludge containment fully emptied?
- Did you add any water to the onsite faecal sludge containment?
- What is the source/origin of sludge (i.e. household, multiple household, institution/industry, hotel/restaurant, school, public toilet, other)
- Was the faecal sludge containment a lined pit latrine, or Septic Tank?

Questions to customers

- If a household, number of inhabitants?
- Types of wastewater entering system (i.e. toilet, bathing/washing, kitchen, other)?
- Does solid waste enter the faecal sludge containment, yes or no? If yes, what types (e.g. hygenic products, food waste, other)?
- Age of faecal sludge containment (i.e. <5 years, 5-10 years, 10-20 years, exact age if known)?
- Do you have a water connection?
- Volume of containment?
- Have you ever had the faecal sludge containment emptied? If yes, when?
- Do you add bio-additives? If yes, how often?
- Is the faecal sludge containment watertight?
- If Septic Tank, how many chambers?
